DESIGN & ACCESS STATEMENT

Design of Building

Modern portable framed building for ease of access for cleaning out and good ventilation for cattle.

Grey fibre cement roof chosen as not to stand out in the environment.

Yorkshire boarding to be used as side cladding on three sides used for good ventilation and to blend in with the landscape.

Bottom of building to be clad in concrete panels to aid the retention of any\muck and stop any pollution into the water courses and water table.

The same reason concrete panels will be used for the muck store, this will be sloping inwards to contain any dirty water.

The building will have native trees planted in front. In time this will shield the building.

The yard in front of the building will be concreted and any water from gutters will be harvested and used as drinking water for the cattle.
