Buxton SK17 6QH

Proposed Retention of Electronic Scoreboard

Lighting Detail

The electronic scoreboard comprises lighting within panels controlled remotely. It is the lighting itself which forms the lettering/symbols etc on the display face. There is no other lighting involved such as external lighting which is often used for a facia sign / advert.

The submitted document from the supplier of the scoreboard sets out various technical details including lighting. This confirms the scoreboard to comprise an aluminium finish in matt black coating; with light intensity/brightness at 6500cd/m2; using high bright LEDs; in full colour.

The front face of the scoreboard is visible form a short section of the adjacent highway, being a local no through road giving access to a limited residential development. The rear of the scoreboard is visible from adjacent dwellings but is not illuminated when in use.
